Abstract

In the age of Artificial Intelligence (AI), the potential for AI-powered tools to revolutionize history education is immense, offering students worldwide quick and precise resources to investigate the depths of history. However, the critical factor lies in ensuring the accuracy of these tools to benefit learners truly. To address this concern, a qualitative research study was conducted to explore the research gap surrounding AI-generated responses related to two historical conflicts with conflicting historical narratives: Palestine-Israel and Ukraine-Russia. The aim was to scrutinize the accuracy and potential biases present in AI-generated content. The findings from the study revealed that ChatGPT, an AI language model, exhibited bias that reflected the political stance of the United States when responding to prompts related to historical conflicts. While the use of ChatGPT for historical learning purposes has shown promise in enhancing access to historical information, the study highlighted the model's inherent bias, indicating its unreliability when compared to primary historical sources. As a result, there is a clear need for future research endeavors to focus on developing inclusive and impartial AI-powered learning models to ensure accurate and unbiased historical education.

Keywords: Artificial Intelligence; history education; bias; accuracy; ChatGPT; historical conflicts.

Introduction

The discipline of history, an indispensable facet of formal education worldwide, serves as a lens through which societies interpret and understand the human past. Defined succinctly by Hirst (2019) as the examination of events from the past as documented in written records created by people, history is a complex tapestry of narratives, interpretations, and perspectives. However, as is any representation of reality, history is susceptible to bias and inaccuracy. As McCullagh (2000) argues, the inherent biases of historians, influenced by their personal interests and cultural origins, can permeate historical accounts, making the quest for accuracy elusive. Another challenge that characterizes the study of history is the multiplicity of historical narratives; explained by Ranke (1824), the goal of history 'is the observation of this life which cannot be characterized through One thought or One word' (cited in White, 1973, p. 165). In line with this viewpoint, the diversity of historical representation and interpretation is a direct consequence of the multitude of perspectives through which historians tackle a single subject of study.

History education is a state-organized part of formal education that seeks not only to inform but also to perpetuate historical narratives that align with the national vision of the state (Van Ommering, 2015). Hence, history education, in its traditional sense, is inherently biased; it seeks not to represent the diversity of historical representation but rather to promote a historical reality conducive to a robust national identity. However, new definitions argue against this exclusive view; according to Mayo (2020, cited in Fink, 2023), history education should prioritize factuality, cover comprehensive world history, include subjects beyond politics and war, connect past events to current and future issues, and promote critical thinking. In acknowledgment of the aforementioned perspectives, the emergence of Artificial Intelligence (AI) in the realm of formal education in general, and the realm of history education in particular offers both novel opportunities and challenges.

AI-powered tools have the potential to revolutionize history education by providing students with quick and accurate resources to explore history. However, the accuracy and impartiality of AI-generated historical content remain questionable. This research explores the interplay between history education and AI, specifically examining the accuracy or bias of the generative AI model ChatGPT in its generated content related to two historical conflicts: Palestine-Israel and Ukraine-Russia. The objective is to assess the potential of ChatGPT as a tool for history education. By doing so, the study contributes to the ongoing debate on history education, the quest for historical accuracy, and the role of AI in shaping the future of history learning.

1. Literature Review

1.1 History Education through Primary Sources

According to Morgan & Rasinski (2012), primary sources, such as letters, speeches, and photographs provide immediate and unaltered perspectives on historical events. Primary sources are considered the "raw materials of history" (Ibid, p. 584). In contrast, secondary sources provide accounts or interpretations of events by individuals who did not have firsthand experience. Primary sources are then at the core of historical knowledge. They represent the first layer of historical representation, allowing us to venture into the events as closely as possible.

Kelley (2017) highlights the importance of primary sources by stating Thucydides' perspective on who writes the best history in which he argues that 'history is best written by those who have participated in or witnessed the events in question' (Ibid, p.498). According to Morgan and Rasinski (2012), primary sources allow students to experience historical moments firsthand, which promotes critical thinking and an eagerness to ask questions. This prompts students to seek corroborating evidence and engage in historical discussions.

Cayley (2021) articulates several reasons why primary sources are crucial in education, one of which is that engaging these sources in teaching aids in developing better citizens. Following this viewpoint, historical documents are essential for cultivating responsible citizenship, which underpins a fair and efficient society. Cayley (2021) goes on to explain that primary sources allow students to explore the foundational evidence of a nation's history, including its governmental origins, value systems, and international presence. To be effective catalysts for positive change, students need to be well-informed citizens.

1.2 History Education through Search Engines

A search engine is a program where users search for answers or responses to queries (Britannica, 2023). Examples of search engines are Google, Bing, Yahoo, and Naver. However, Google is the most used and most popular search engine in the world, with 90.68% search engine market share in 2023 followed by Bing with 3.23% and then Yahoo with 3.17% (Similarweb, 2023). In a study conducted by (Salehi et al., 2018), they realized that more than 83% of participants trusted search engines and ranked them as relevant to their studies. They also added that these participants relied on search engines because they considered them reliable sources (Salehi, Du, & Ashman, 2018).

Education, in the period of Covid-19, was digitalized. In other words, schools, teachers, and students adopted online courses in which classes were held virtually, and bit by bit students got used to the new method of studying (Holden et al., 2021). Students used to rely on search engines for entertainment; yet, with the rise of online classes, students started using search engines for educational purposes (Anuyah et al., 2019). Search engines are used by students because they facilitate their tasks and school projects (Hussain et al., 2011).

Students' dependency on search engines has advantages and disadvantages (Salehi et al., 2018). Virtual education promotes autonomous learning in which learners conduct research and study without superior guidance, and this is one of the advantages of using search engines as a source of information (Salehi et al., 2018). On the other hand, search engines are biased (König & Rasch, 2014). As stated by König and Rasch (2014) search engines tend to shape one's thinking by sharing certain content that is biased and not neutral. For instance, when it comes to history, there is no unified discourse; however, the diversity of discourse affects the objectivity of sources as they differ in terms of information and accuracy. König and Rasch emphasized the fact that search results are influenced by personalization, localization, and selection, thus challenging the notions of neutrality and objectivity (König & Rasch, 2014, p.13).

1.3 Generative AI

Despite the perception that artificial intelligence is a recent development, interest in this field dates back to the early 1950s (Rockwell, 2017). From funding obstacles to computational incapacity, AI has gone through many hardships to get to where it is now. The shift from traditional AI to today's advanced generative capabilities marks a profound transformation driven by numerous advancements and innovations. According to Wang (2024), Generative AI significantly diverges from traditional AI and machine learning by creating new data in various media forms rather than just analyzing existing data.

Wang (2024) also explained that while traditional AI focuses on pattern recognition and predictions using predefined programming, generative AI uses advanced neural networks like transformers to generate and refine outputs through human feedback. Artificial intelligence has gained attention as it simulates human intelligence (Lim et al., 2023). Generative AI is a model trained to generate responses to users' prompts (Sætra, 2023). However, its effectiveness and accuracy are questioned by scholars to decide whether generative AI is accurate and neutral or biased and subjective. Generative AI

is a trained model that is equipped with a massive input which in turn is transformed into an output that suits the users' prompts by generating responses that can fulfill one's curiosity (Sætra, 2023). Generative AI integration into the educational system aims to boost classroom engagement and facilitate information accessibility (C.Acun & Acun, 2023). In the same study, many students voted that ChatGPT is accurate and that sometimes it generates accurate and similar information to the ones in books.

In a study conducted by Haraldstad in 2024, he integrated AI into his teaching methods to examine its accuracy in generating information as it becomes an integral part of the educational landscape. In one of his experiences with his students in their history class, they perceived that ChatGPT, an AI research lab, generates personalized information that is inaccurate and biased (Haraldstad, 2024). He recommended that validation is essential, and verifying information should be standard practice for all users of a Chatbot. Similarly, C. Acun & Acun (2023) addressed the topic of accessibility, revealing that 8.4% of their participants identified ChatGPT as a misleading source of information, providing inaccurate responses in contrast to primary sources.

1.4 History education through Generative AI and ChatGPT

Using artificial intelligence to learn about history involves analyzing and interpreting historical data using multiple technologies and methodologies. The examination of copious amounts of data, including digital records, extensive manuscripts, and archives, is a fundamental aspect of historical research. AI's machine learning techniques enable it to quickly examine and classify data, greatly accelerating the research process. Historians can now easily access historical materials with improved accuracy, enabling them to focus more on interpretation and analysis rather than tedious data collection (Teel, 2024).

Over the past few years, there has been substantial progress in the development of artificial intelligence (AI), which integrates data, algorithms, and computation. AI systems can detect patterns, trends, and correlations in large volumes of historical data from texts, photographs, and other sources (Messner, 2022). Consequently, machine learning, or AI, uses an algorithm to feed raw data so that models may generate meaningful outputs (Sarle, 1994). It is a collection of computer technology that enables humans to decide sensibly in a range of challenging circumstances (Tredinnick, 2017). OpenAI has been at the vanguard of AI research and has created a number of ground-breaking models, including GPT-2, GPT-3, and ChatGPT-4, and has as its

main goal, to advance artificial general intelligence (AGI) for the good of humankind (Ray, 2023).

Immersive learning experiences may be generated by using AI-driven virtual reality (VR) and augmented reality (AR) technology to replicate historical contexts, occasions, and scenarios. Through virtual exploration, students may get a deeper grasp of historical venues significant events, and ancient civilizations. The potential for improving the educational system is immense with these two cutting-edge technological developments (Tan et al., 2022). In addition to allowing lecturers to tailor their lessons to each student's unique learning style, AR and VR expose students to immersive digital experiences that are not possible to replicate through traditional teaching methods (Phakamach et al., 2022). This helps students better engage with complex material beyond lectures and textbooks (Sun et al., 2022). However, with the further evolution of generative AI, the creation of AI-produced text detection platforms has gained traction, sparking debates over the legitimacy of machine-generated content and detection methods (Dalalah & Dalalah, 2023). Given the bias of the system's data intake, biased results are probably in store (Huang & Rust, 2021). Data security, privacy issues, and moral conundrums including staff replacement and AI justice are some of the dilemmas facing the usage of this advanced technology (Wirtz, Weyerer, & Sturm, 2020).

2. Methodology

The objective of the present qualitative research endeavor is to analyze the extent to which ChatGPT, a generative AI model, can be used as a tool for history education. Multiple sources were used to gather informative data for this study; ChatGPT generated the main data in response to user prompts on the two conflicts of Palestine-Israel and Ukraine-Russia. Primary sources and official US media outlets were the sources of the comparative data.

2.1 Materials

To fulfill the aim of this research, various materials were employed. The main data was sourced from the outputs generated by ChatGPT, a chatbot created by OpenAI in 2022 (Hetler, 2023). To assess ChatGPT data in terms of bias, different primary sources were consulted. The main primary sources for the Palestine-Israel conflict are 'Expulsion of the Palestinians: The Concept of "Transfer" in Zionist Political Thought, 1882-1948' by Quandt and Masalha (1993), 'An Introduction to the Study of the Arab-Israeli Conflict' by Abdel Wahab El-Messiri (2003), and 'Ben-Gurion's notorious quotes: their polemical uses & abuses. Partners for Progressive Israel' by Rseliger (2006).

To analyze Ukraine-Russia generated outputs, ‘Our experts decode the Putin speech that launched Russia’s invasion of Ukraine’ by Messieh (2023), ‘Remarks by President Biden on Russia’s Unprovoked and Unjustified Attack on Ukraine’ from the White House’s website (2023) along with Zelensky’s statements cited in Aljazeera (2021), Ver Leyen’s statements on Russia’s aggression (2022) and ‘Joint statement on Russia’s invasion and importance of freedom of expression and information’ by Office of the United Nations High Commissioner for Human Rights (OHCHR) in 2022 were all be employed. As final materials for this research, the official White House website was consulted for inferring the US official statements concerning the two conflicts.

2.2 Procedure

The main data for this research was generated by ChatGPT in response to three specific prompts for each conflict under investigation. The selection of these prompts was well-structured and methodical. The first prompt utilized language that is free of any biased or subjective words. This approach aimed to obtain a general overview of the conflict in an objective way. The second prompt favored the first party in the conflict, and the third favored the second party. This step aimed to examine if ChatGPT’s responses were influenced by the value-laden language in the prompts or if it had its own inherent agenda in its outputs, regardless of the prompt’s wording.

Afterward, ChatGPT’s outputs were compared with the corresponding primary data to identify potential ideological alignments. The primary sources were not chosen randomly, but carefully as they highlight the situations of the three issues from two opposite perspectives. That is to say, for the Palestinian-Israeli conflict, authors of opposing views were consulted. Lastly, the Russian-Ukrainian conflict output as generated by ChatGPT was compared to primary data sources that represent the three perspectives of Ukraine, Russia, and the West.

The comparative analysis was carried out in a conflict-by-conflict manner. This involved placing the combined outputs of the three prompts alongside the corresponding primary data. The primary focus was on inferring recurrent words, identifying patterns of exclusion, and detecting potential differences in vocabulary items attributed to the different parts of the conflict. The findings of this part contributed to a deeper comprehension of the nuances and dynamics of the conflicts under study. Several correlations were detected through this comparative analysis. Subsequently, ChatGPT’s data was juxtaposed with the U.S. political statements, as derived from the abovementioned sources, to assess alignment with official political narratives.

Similarly, the focus was on the terminology used, patterns of exclusion, and emphasis. The analysis was aimed at gauging the alignment of ChatGPT's outputs with the American political narrative.

3. Results and Discussion

3.1 Palestine-Israel conflict

The data provided in the table showcases the insights generated by ChatGPT regarding the Palestinian-Israeli conflict. The initial response highlights the intricate nature of the situation, acknowledging the involvement of multiple factors and adopting a neutral tone. However, the generated output started with Israel and then Palestine, reversing the order of the countries compared to the original prompts. Moreover, ChatGPT demonstrated clear bias in its description of Israel and Palestine, calling the latter a 'potential Palestinian state', rather than an existing one; this bias is confirmed again when ChatGPT, in describing the importance of Jerusalem for both states, described Palestine as a 'future state'. ChatGPT's generated answer for the second prompt addressed the Palestinian struggle with Israel, indicating that Palestinians attempt to take back their lands from Israel's occupation and that the rocket attacks made by groups such as Hamas are responses to Israel's operation, referring to Hamas' actions as 'resistance'; however, in the third prompt, ChatGPT highlighted the Israeli fight with Palestine and talked about the resistance as a terrorist act against Israeli civilians and that the threats are from hostile neighbors, referring to Palestinians.

The response to query 2, inquiring about the Palestinian struggle, underscored ChatGPT's bias by framing the Palestinian struggle as a product of their perception rather than their lived experiences. This is clear in the use of terms like 'perceived injustices' and 'perceived Israeli aggression' to describe Israel's aggressions. Output 3 also highlighted the model's bias because of its use of terms like 'hostile neighbors' to refer to Palestinians, and the use of 'civilians' and 'citizens' to refer to Israelis, which the model did not do when talking about Palestinians. Upon comparing the second and third prompts, it becomes evident that certain words such as 'settlements', 'occupation', and 'conflict' are reiterated, while the term 'civilians' is mentioned only twice. The response to query 2, inquiring about the Palestinian struggle, underscored ChatGPT's bias by framing the Palestinian struggle as a product of their perception rather than their lived experiences. This is clear in the use of terms like 'perceived injustices' and 'perceived Israeli aggression' to describe Israel's aggressions.

Table 1: ChatGPT-generated outputs on the Palestine-Israel conflict.

Prompt	Output generated by ChatGPT
Prompt 1	➤ Use of ‘potential Palestinian state’ and ‘future state’ to refer to Palestine
Prompt 2	➤ Use of ‘resistance’ to refer to Hamas. ➤ Use of ‘Civilians’ without specifying ‘Palestinian Civilians’ ➤ Use of ‘perceived injustices’ to refer to Israeli occupation injustices against Palestinians. ➤ Mention of ‘refugee issue’ without referring to its cause. ➤ About Hamas’ resistance: ‘These actions are often seen by Palestinians as a response to perceived Israeli aggression and occupation.’
Prompt 3	➤ The struggle is about Israel’s efforts to ensure its security and identity. ➤ Use of ‘citizens’ and ‘Israeli civilians’ to refer to Israelis. ➤ Use of ‘hostile neighbors’ to refer to Palestinians. ➤ Use of ‘terrorism, rocket attacks’ to refer to Palestinian’s actions.

Output 3 also highlighted the model’s bias because of its use of terms like ‘hostile neighbors’ to refer to Palestinians, and the use of ‘civilians’ and ‘citizens’ to refer to Israelis, which the model did not do when talking about Palestinians. Upon comparing the second and third prompts, it becomes evident that certain words such as 'settlements', 'occupation', and 'conflict' are reiterated, while the term 'civilians' is mentioned only twice. Interestingly, ChatGPT uses the term 'civilians' without specifying 'Palestinian civilians' when discussing the Palestinian struggle. However, when it comes to ChatGPT’s answer for the third prompt, the model described Israelis as ‘Israeli civilians’. Moreover, the word ‘terrorism’ is mentioned in the third prompt when highlighting Palestinians' acts of responding to Israel's operations like home destruction. However, for the third prompt, ChatGPT’s output identified the barriers and checkpoints made by Israel as a response to threats by Palestinians.

Concerning relevant primary data, Table 2 provides a summary of the primary data sources that present different perspectives on the conflict. The data includes the Arab perspective, which opposes Israel and Zionism, as well as two contrasting Israeli perspectives. One perspective celebrates the occupation of Palestine as a manifestation of Zionism, while the other recognizes Zionism as an integral part of Israeli ideology without condemning Arab actions against it. The former was exemplified by Rabbi Meir Berlin’s viewpoint on the land of Palestine, and the latter was represented by Ben-Gurion, the first Israeli Prime Minister. When comparing these findings with the data generated by ChatGPT, one notable observation is that the model often describes Palestine as a 'future state' or a 'Potential Palestinian state', indicating its comprehension of the concept of Palestine. Surprisingly, this goes even against Ben Gurion’s perspective, which asserts that the land belongs to the Palestinians and that Israel occupied it.

With a clear understanding of the perspectives held by both parties, it is evident that ChatGPT's outputs lacked consistency, shifting from neutrality to displaying pronounced biases. Upon a second examination, it became evident that the results were organized in a manner that revealed a distinct and significant prejudice against Palestine within the model. For the first prompt, which is objective, ChatGPT’s output was biased against Palestine; this supports Israel’s perspective. In addition, for the biased second and third prompts, ChatGPT produced outputs that favored Israel’s perspective on the conflict.

Table 2: Relevant data from primary sources on the Palestine-Israel conflict.

Arab perspective	Israeli perspective
1. The current Zionist phenomenon is settler genocidal colonialism, and the Arab resistance to it is no different from the resistance of oppressed peoples to invading settlers. (El Messiri, 2003)	1. “If I were an Arab leader, I would never sign an agreement with Israel. It is normal; we have taken their country... Why would they accept that?” (Ben-Gurion, cited in Rseliger, 2006)
2. Ben Gorion admits that Arab resistance is not terrorism. He believes that Israel’s peace-making with Arabs is nothing but a tool for	2. ‘The basis of Zionism is that the land of Israel is ours and not the land of the Arabs, and not because they have large territories, and we have but little. We demand Palestine because it is our country’ (Rabbi

the establishment of complete Zionism. (El Messiri, 2003)	Meir Berlin, cited in Quandt & Masalha, 1993)
---	---

It is also important to take into account the viewpoint of the United States in this research. ChatGPT 3.5 was trained using data that was available until January 2022, so the American position on this issue was obtained before the data cut-off for ChatGPT. The comments made by President Biden on the Palestine-Israel conflict in 2021 showed the country’s unwavering support for Israel’s ‘self-defense’. His comments came during the Sheikh Jarrah Crisis (Alsaafin, 2021). The U.S. President talked about the terrorist groups that attacked ‘innocent’ Israeli civilians. Moreover, President Biden did not mention Palestine’s death tolls, nor did he employ the term ‘Palestinian civilians’ to refer to Palestinians as he did to Israelis; this is similar to ChatGPT’s generated output. In addition to that, the President expressed that both Palestinians and Israelis deserve to live in peace and equality. ChatGPT’s generated data reflected this neutrality to an extent. As previously stated, terms like ‘potential Palestinian state’ and ‘future state’ imply contradictory meanings. Responses from ChatGPT frequently showed inconsistency, initially favoring Israel and aligning closely with President Biden's position.

3.2 Ukraine-Russia conflict

Table 3 reveals ChatGPT’s generated outputs for the Ukraine-Russia conflict in terms of the three prompts. For the first prompt, ChatGPT started by describing the situation between Ukraine and Russia in a fairly neutral manner, reflecting the prompt’s wording. However, analyzing the data revealed that ChatGPT primarily discussed the actions taken by Russia against Ukraine, without presenting Russia's perspective or explaining the motivations behind these actions, leading to international disapproval of Russia's actions. Based on the data, it is evident that Russia's actions and justifications are not attributed to Russia as the perpetrator, except for when ChatGPT mentioned the annexation of Crimea.

In addition, the data indicates that it is not solely Ukraine that opposes Russia, but rather the Western nations as a whole. ChatGPT goes on to explain that Russia's aggressive behavior and quest for dominance are key factors contributing to the strained and tense relations between Russia and the West. The second prompt was biased towards the Ukrainian perspective. Accordingly, ChatGPT’s output adopted a pro-Ukraine viewpoint, representing Ukraine as the victim of Russia’s actions. ChatGPT also highlighted Ukraine's efforts to maintain sovereignty, and territorial integrity

while pursuing Western integration. This perspective goes against Russia’s desire to ‘influence’ the region. Not only that but the support from Western countries was highlighted again in the second answer, reflecting ChatGPT’s inclination to consolidate Ukraine’s cause.

The third prompt was biased toward the Russian perspective, which was reflected at the beginning of the generated output; ChatGPT elaborated on the conflict from the Russian perspective, highlighting Russia's efforts to assert its influence in Ukraine, protect its relations in the region, and prevent Ukraine from integrating into the Western community. However, as we delve further into the data, it is clear that the model did not represent Russia, as the victim, which it did with Ukraine. ChatGPT, despite its initial claim of neutrality, had the potential to produce content depicting Russia as the aggrieved party rather than Ukraine. Moreover, despite the pro-Russian wording of the prompt, the model emphasized Russia's support for separatist movements, as well as the opposition to Russia’s actions by "most of the international community".

Table 3: ChatGPT-generated outputs on the Ukraine-Russia conflict.

Prompt	Output generated by ChatGPT
Prompt 1	➤ ‘Many Western countries accuse Russia of supporting separatists’, ➤ ‘Sanctions have been imposed by the West on Russia ‘, ➤ Focus on Ukraine’s perspective, and the actions inflicted upon it. No mention of Russia’s perspective, except for its annexation of Crimea in 2014
Prompt 2	➤ ‘Ukraine's efforts to maintain its sovereignty, territorial integrity, and pursuit of Western integration.’ ➤ ‘Russia's attempts to assert its influence in the region and prevent Ukraine from aligning with Western institutions ‘ ‘... which was not recognized by most of the international community’
Prompt 3	➤ ‘Russia's efforts to assert influence in Ukraine, prevent Ukraine from aligning with Western institutions’ ➤ ‘Not recognized by most of the international community’, ‘Russia caused instability because of separatist movements’

	➤ ‘Russia opposes Ukraine's efforts to make ties with Western democracies.’ ➤ ‘Russia's actions in Ukraine led to international condemnation’
--	---

The primary data also revealed three different perspectives on the conflict. The first perspective was represented by President Zelensky who considers Russia an occupying force that, if not stopped, poses a threat to global security. Zelensky consistently portrays the West as a key participant in the conflict, either praising their support or urging Western nations to increase their efforts, not just for the benefit of Ukraine but also to maintain stability in the Western world. From a Russian standpoint, as represented by President Putin, Russia seeks peace and has a moral obligation to ensure regional security. For Putin, Ukraine is not just the

Table 4: Relevant data from primary sources on the Ukraine-Russia conflict.

Ukrainian perspective	Russian perspective	Western perspective
1. “Occupation of Crimea casts doubts on the effectiveness of the entire international security system.” (Zelenskyy, as cited in, Ukraine’s President Pledges to ‘Return’ Russia-annexed Crimea, 2021)	1. “Russia is seeking peace ... Russia has a moral obligation to do something about security in the region...Ukraine is aggressive... The West is creating tensions in the region.... Ukraine is a puppet of the West” (Putin, 2022, as cited in Messieh, 2023)	1. ‘President Putin has chosen a premeditated war that will bring a catastrophic loss of life and human suffering...The world will hold Russia accountable.’ (The White House, 2022b)
2. ‘We will ensure Russia's full accountability for what it has committed against Ukraine and Ukrainians at all levels, including at the legal level. And I thank all the partners who help bring the verdicts closer	2. ‘I have already said that Russia accepted the new geopolitical reality after the dissolution of the USSR... Russia cannot feel safe while facing a permanent threat from the territory of	2. ‘It is President Putin, who is bringing war back to Europe.’ (Der Leyen, Press Corner, 2022)
		3. ‘We collectively condemn the invasion of and continuous aggression against

to the occupiers – Russian murderers and terrorists.’ (<i>Speeches</i> , 2021)	today’s Ukraine.’ (Putin, 2022, as cited in Messieh, 2023) 3. Putin condemned the West’s actions that caused destabilization in the Middle East and North Africa. (Putin, 2022, as cited in Messieh, 2023)	Ukraine...’ (OHCHR, 2022)
--	---	---------------------------

aggressor in the conflict but it is also a puppet of the West. Furthermore, the President argues that after the dissolution of the Soviet Union, Russia maintained respect toward all post-Soviet states, but Ukraine posed a permanent threat to Russia. Lastly, Putin criticizes the West for disregarding international law and causing destabilization in the Middle East. The Western perspective on the conflict consistently condemns Russia and supports Ukraine, as suggested by President Biden’s speeches, blaming Putin for the potential loss of life. The European Commission also holds Russia accountable for bringing war back to Europe, while the OHCHR condemns Russia’s actions violating international law (OHCHR, 2022). Comparing these perspectives to ChatGPT’s output, it is evident that the model reflects both Ukraine’s and the West’s condemnation of Russia’s actions. However, ChatGPT fails to elaborate on the West’s actions against Russia, focusing solely on Russia’s actions against Ukraine.

The speeches by the U.S. President J. Biden on Russia’s unjustified war against Ukraine revealed the American stance towards the Ukraine-Russia conflict. The U.S. president declared on many occasions that Russia’s attack was brutal and unjustified, describing Putin as an ‘aggressor’. Biden shed light on Ukrainians while he did not mention the Russians when he said that Putin and his country ‘will bear the consequences’ (Biden, as cited in House, 2022). This goes hand in hand with ChatGPT’s bias towards the Western and Ukrainian perspectives.

Conclusion

The present research paper attempted to bridge the gap between history education and generative AI; the objective was to assess the ability of ChatGPT, a generative AI model, as a tool for history education. To evaluate

ChatGPT's utility as a tool for history education. Three specific prompts were employed for each conflict under study, each designed to elicit varied responses. These prompts were systematically crafted: the first neutral, the second favoring one party, and the third favoring the opposing party. The resulting outputs were then compared with primary data sources representing diverse perspectives on the conflicts. This comparative analysis focused on identifying recurrent words, patterns of exclusion, and differences in vocabulary usage. ChatGPT's outputs were then compared with the political stance of the US to infer any possible political alignments.

The study demonstrated ChatGPT's inherent bias against Russia and Palestine, echoing closely the Political position of the US in both conflicts. The findings also revealed that while ChatGPT produced coherent and occasionally accurate responses, it remains unsuitable for historical education because of its evident bias and unreliable answers. Additionally, the fundamental characteristics of history education, as specified by Mayo (2020), were not completely reflected in ChatGPT's historical content. Thus, for generative AI to contribute more to history education, it has to be upgraded to cover everyday updates concerning historical events and their current status as their status is unstable. By doing so, researchers and laymen would become aware of date-to-date events. Also, it is essential to incorporate references to clearly indicate the perspective from which the output was derived. This highlights a constraint of the current research.

Additionally, the research data solely relied on ChatGPT-3.5, an AI Chatbot accessible to the public for free. To ensure the generalizability of the findings to all generative AI, future studies should investigate multiple AI models, both free and paid, to determine potential biases or accuracy. Additionally, incorporating a wider range of diverse and multiple questions would have yielded more valuable insights, enabling further analysis of the generated output for neutrality or bias.

Recommendations for future research encompass further exploration of these findings to develop inclusive and impartial AI-powered learning models. This would facilitate the delivery of accurate and unbiased historical education, enabling learners to understand both perspectives of a conflict efficiently and accurately. Furthermore, another recommendation would be for researchers to point out and address more instances of bias in generative AI, serving to shed light on conflict parties who are usually underrepresented in biased media and partial secondary data sources.
